

AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions and listings of claims in the application:

LISTING OF CLAIMS:

1. (original): An image transformation apparatus comprising:

an image receiving section for receiving an image represented by digital data;

an image sort discrimination section for discriminating whether the image received by said image receiving section is a halftone dot image or a multiple gradation image;

an image transformation section for applying a conversion processing for the multiple gradation image to the halftone dot image when it is decided by said image sort discrimination section that the image received by said image receiving section is the multiple gradation image;

and

a driver section for outputting an image discriminated as the halftone dot image by said image sort discrimination section and an image converted into the halftone dot image by said image transformation section to an image output device for outputting a visual image.

2. (original): An image transformation apparatus according to claim 1, wherein said image receiving section receives a color image, and said image transformation section applies a color conversion processing to a color image decided by said image sort discrimination section that the image received by said image receiving section is the multiple gradation image, and applies the conversion processing for the multiple gradation image to the halftone dot image.

3. (original): An image transformation apparatus according to claim 1, wherein said image receiving section receives together with the image additional information indicating whether the image received by said image receiving section is the halftone dot image or the multiple gradation image, and said image sort discrimination section discriminates whether the image received by said image receiving section is the halftone dot image or the multiple gradation image in accordance with the additional information.

4. (original): An image transformation apparatus according to claim 1, wherein said image receiving section is adapted to receive a binary halftone dot image and a 256 gradation of multiple gradation image.

5. (original): An image transformation program storage medium storing an image transformation program which causes a computer system to operate as an image transformation apparatus for performing an image transformation upon receipt of an image represented by digital data, when the image transformation program is executed by the computer system, said image transformation program comprising:

an image sort discrimination section for discriminating whether the received image is a halftone dot image or a multiple gradation image;

an image transformation section for applying a conversion processing for the multiple gradation image to the halftone dot image when it is decided by said image sort discrimination section that the received image is the multiple gradation image; and

a driver section for outputting an image discriminated as the halftone dot image by said image sort discrimination section and an image converted into the halftone dot image by said image transformation section to an image output device for outputting a visual image.

6. (original): An image transformation program storage medium according to claim 5, wherein said image transformation program causes the computer system to operate as an image transformation apparatus for performing an image transformation upon receipt of a color image, when the image transformation program is executed by the computer system, and

wherein said image transformation section applies a color conversion processing to a color image decided by said image sort discrimination section that the received image is the multiple gradation image, and applies the conversion processing for the multiple gradation image to the halftone dot image.

7. (new): The image transformation apparatus of claim 1, the image receiving section is adapted to receive images from a raster image processor.

8. (new): The image transformation apparatus of claim 1, the image receiving section is adapted to receive a ternary halftone dot image or a quaternary halftone dot image.

9. (new): The image transformation apparatus of claim 1, the image receiving section is adapted to receive a multiple gradation image of 128 gradations or 1024 gradations.

10. (new): The image transformation apparatus of claim 1, wherein the received images do not have page description language.
